VERTICAL

Process of Application on Site

ACI Stamped wall is made using pre- mixed plaster ACI Wall-Eco. ACI Wall-Eco is characterized by long work ability and can be applied in thicknesses from 1 to 3 cm directly on concrete surfaces, bricks, stone and, after adequate sub-base preparation, even on plaster boards, polystyrene, wood and metal.

Once the plaster has been spread out and made smooth, it will be possible to apply the liquid release agent and to texture the surface using ACI work professional tools. Next day the textured surface is cleaned and then stained using ACI works Rainbow Colours.

Once the wall is completely dry it will be possible to apply a protective sealer: *ACI sealer ACI Medium* (for outdoor applications) or *ACI Acrylic Resin* (for interior). To create artificial rocks, a special version of the plaster, ACI Tix, is used. Its thixotropic formulation makes it perfect for decorating with great shock resistance (similar to concrete) and with thicknesses up to 6-7 cm.

NATURAL STONE DESIGN

Vertical stamping application comes in various types, designs and colors. Types are *Natural Stone design*, *Natural wood design*, *English Brick*, *Travertino*. We have multiple choices to match your decor. They are easy for application and installations. It is beautiful and gives the aesthetic natural look to your wall.

ACI DESIGNER CONCRETE

THE VISUAL CONCRETE

Introduction

While grey might be the first image that comes to mind when we think about concrete, allow us to help your mind's eye see a little further.

As a common material, concrete displays essential beauty, with the natural appearance of a calm-charm. The material has a soft feel, a rigid sense of warmth with cold and flu, so architects believe that this is a noble simplicity, seems to be simple, in fact, more than the magnificent effect.

Redefining Aesthetics of Concrete

Concrete, of course, is a popular building material that creates a distinctive architectural style that is liked by many but a good impression can be spoiled if there are too many pores on what was supposed to be a smooth surface.

If we overcome all these factors and develop working skills & techniques to control the behaviour of the concrete, it will help to achieve an architect's vision.

Meanwhile, the finishing techniques can be revolutionary & economical, to transform colours & visuals.

Innovation and developments is a continuous process

Now we present "ACI Designer Concrete". We observed that the visual concrete can be used as a style element, especially in the luxury or prestigious sector of architecture, be it a single family house, hotel or a company headquarter. Whether it is the exterior, interior, bedroom, stair, washroom, living or dining room, visual concrete speaks a chic lifestyle..

ACI Designer Concrete (the visual or exposed concrete) is a new revolutionary building material which is applied with a thickness of 2-5 mm.

ACI Designer Concrete is an effort to put into frame, the ideas of architects and designers to allow the concrete look fascinating and dramatic on walls, ceilings, floors and furniture, without compromising the rigidity and strength inherent in it.

ACI Designer Concrete is a modern concrete system comprising Nano cement, the hardest earthen material, polymer and special additives, modern technology, special tools and exemplary workmanship. This all together imparts our system a unique methodology to present concrete which is beautiful and withstands against the calamities of external weather.
